Read the following passage and answer the questions given.

Type 2 diabetes is a long-term condition that affects how the body can deal with glucose (blood sugar).

As a result of genetics and possibly living with a higher body weight, the body becomes less sensitive to the hormone insulin, which normally helps move glucose from the blood into the muscles so it can be stored and used. This leads to insulin resistance, which can persist for decades.

In people who develop type 2 diabetes, their body's ability to make enough insulin to match the resistance and control glucose starts to fail. So, there is a combination of insulin resistance and reduced insulin production that results in high blood glucose and the diagnosis of type 2 diabetes. If diabetes is not well managed, it can result in short-term symptoms including increased thirst, a frequent need to pass urine, and even weight loss and blurred vision.

If glucose levels stay high for the longer term, it can affect how nerves work and it can affect blood flow to important organs. This can result in complications including blindness, kidney disease, heart disease, loss of sensation, and foot ulcers.
